CORRUGATOR

~ Bridge brake

The bridge brake allows for maintaining constant paper tension. This tension is automatically regulated, obtaining a homogeneity and regularity in the transmission of temperature and the application of glue.

The bridge brake control is pneumatic and features bridge tension control by means of load cells. The system allows for carrying out the control manually by means of a regulator, semi-automatically by consigning the % of tension but without regulating it or automatically by regulating the brake's pressure to achieve the value required in %.
