## CORRUGATOR

### ~ Compensating roller

The compensating roller allows for the readjustment and self-correction of any irregularities the paper may present anywhere along the line.

The compensating roller is used to correct any interruptions due to alignment, widths, lengths, etc.

The compensating roller operates automatically, it is easy to use and highly precise.

#### The system's main advantages are as follows:

- A uniform application of the glue, which contributes towards lowering the amount applied and an improved gluing.
- Tensing of the cardboard band.
- Width compensation.
- Length compensation.
- Quick transferring of heat to the paper.
- Increased cardboard flatness
- Temperature regulation throughout the entire cardboard band. Humidity and temperature are transmitted in a uniform, balanced manner throughout the entire width.
