CORRUGATOR

~ Steam bar

The steam gun is a bar for applying steam that allows for advancing the gel spot along the gluing of the papers.

This results in increased gluing speed, and as a consequence, higher production speed.

The system's main characteristics are:

- Allows for increasing the line's speed for heavy, double or triple corrugated types of paper.
- Application of steam directly to the paper.
- Allows for the pre-gelatinisation of the glue.
- Application is performed before the double facer.
- Long-lasting stainless-steel bar.
- Manual or automatic control are possible, depending on the line's speed.
